

## Terno Scorrevoli

### The company

Terno Agostino set up Terno e Dedè in 1950. The company manufactured hardware items in general and was highly successful thanks to a few products, amongst which the first patent regarding dual wheel castors for furniture (1956). In the years that followed, the company specialised in the production of slider mechanisms for cabinets and internal doors and, later on - around the early eighties - extended the range with slider mechanisms for furniture. In the last 25 years Terno Scorrevoli has distinguished itself in the market for the countless patents it has registered regarding technical innovations for furniture products. It has recently presented the “Space” series, innovative slider mechanisms for cupboard doors which are patent pending for the automatically activated and deactivated anti-derailment system. The new “Space” series also includes extra-tough slider mechanisms having ample side adjustment, self-cleaning brush, chromium bushings, the possibility of using just one type of sliding rail and choosing the type of stop, either traditional or with clip, or the new cushioned stop (patented).

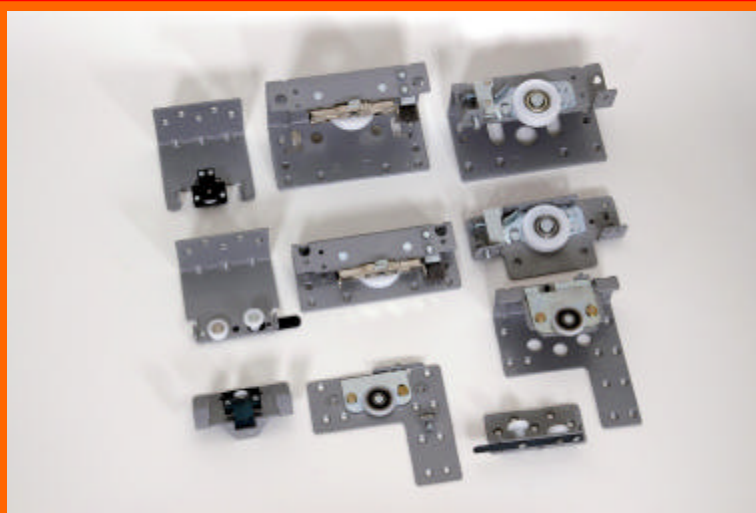

### Terno Scorrevoli and Progetti per il Mobile

In the last few years, Terno Scorrevoli has always sponsored the competition “Progetti per il mobile”, driven by the will to promote the creativity and genius of young people, not only as a path to new ideas, but precisely with the aim of realizing projects that lead to concrete products. Terno Scorrevoli’s proposal for Progetti per il mobile 2008 focuses on “the best sliding mechanism solution”, and concerns the design of a new slider mechanism, or a design to improve an existing sliding system, (for instance, to improve an adjustment or to improve the product’s sturdiness, to simplify assembly of a given component or to improve the form of visible parts or sliders and/or aluminium rails).

In addition, every year Terno Scorrevoli allows the participants to consult its catalogue – which contains many slider systems for cupboards, kitchen furniture, living room furniture, etc. – so that they can take a look at the accessories used for the different types of cupboards and consequently design a new use for existing slider mechanisms that makes them more versatile.

The company is aware of the difficulties of its briefing as it requires a highly technical design, but – every year – Terno Scorrevoli trusts that someone is able to realize a new slider system or is able to provide a new version in terms of design to its aluminium doors to be used with its sliders, and so wishes good luck to all!!!
